ICT 600 HW1 Solution

Disclaimer: This is my attempt to help you learn the material. There might be typos/mistakes.

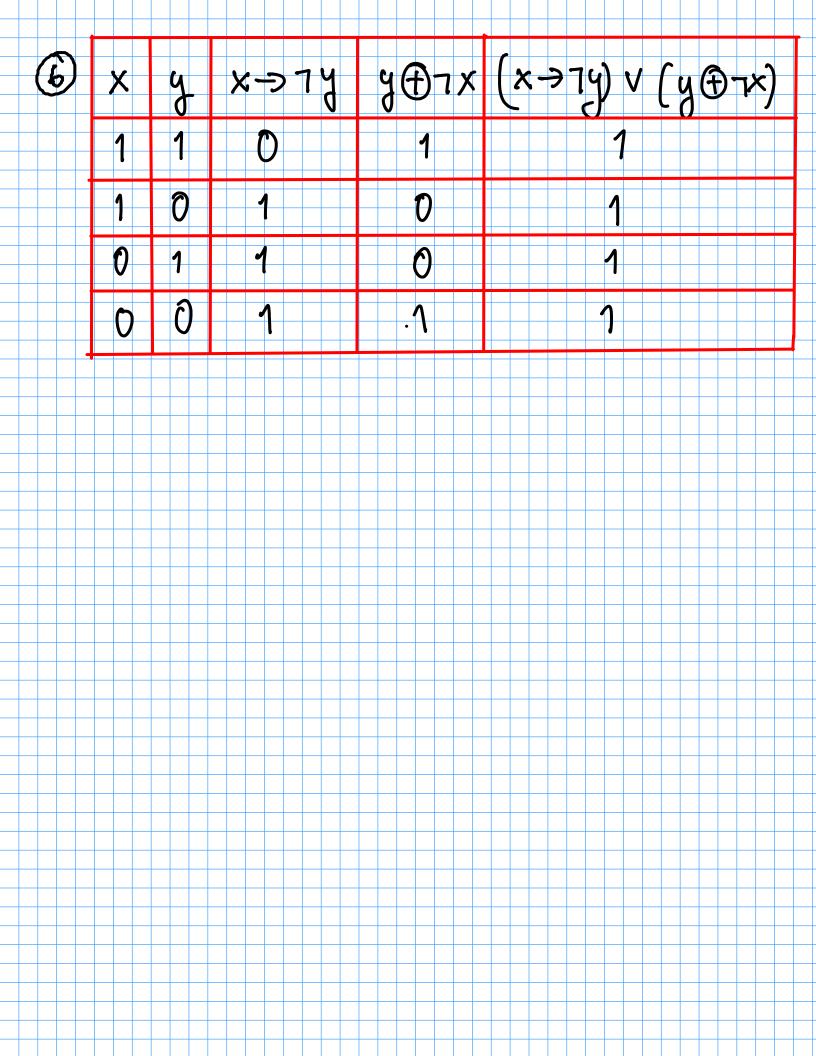

(i)
$$B-A = \{\phi, \{\{a\}\}\}$$

- 2) A is not sub et of B b cau

 a
 A but a
 B.
- (3) $A \times (B-A) = \{(a, \phi), (a, \{\{a\}\}), (\{a\}, \{\{a\}\})\}\}$

4) $f \sim g$ means f(x) = g(x) + C, $\forall x$ Reflexive: f(x) = f(x) + 0 = 0 => f~f Symmetric: f~9 = $f(x) = g(x) + c, \forall x$ = $f(x)-c=g(x), \forall x$ $=) G(x) = f(x) + (-c), \forall x$ => 9~7 Transitive fra and grh =) f(x) = g(x) + c and g(x) = h(x) + d=> fcx> = (ncx) + d)+c=h(x)+(d+c) Therefore t-q is an equivalence relation.

(E) x ~ y means 1x - y 1 = 1 Let x=1, y=2, 2=3 then (x-y1=11-21=151 and 14-21= 12-31=121 But 1x -21= 11-31=2>1 Thus transitive property tails in this sulation. Therefore it is not an equivalence relation.

7) Proof by contradiction Assume that J3 is a notional number Then there exists a, b & 71 such that 13 = a and a,b have no common divisor Then $3 = \frac{a^4}{b^2} = 3a^2 = b^2$ $\Rightarrow 3 | b^2 \Rightarrow 3 | b$ => b=3k for some k & 2 =) $3a^2 = (3k)^2 = 2a^2 = 3k^2$ => 3 a => 3 la contradiction we just show that 31a and 31b but this contradict with our assumption that a, b have no common divisor. Therefore 53 is an irrational number.

8 Direct proof Suppose n is an integer if n is even, then n=2k, ke Z $n^2 + 2 = (2k)^2 + 2$ = 4 k² (2) remainder = 2 4 / n²+2 if n is even if n is odd, then n=24+1, ke I n2+2 = (2++1)+2 = 4ke+4k+1+2 = $4(\xi^2 + \xi) + (3)$ remainder = 2 4 \uparrow n^2 +2 if n is odd. Therefore if n is om integer Then n²+2 is not divisible by 4.
